

*Better Buildings Residential Network
Peer Exchange Call Series*

*The Cost of Cooling:
Air Conditioning, Climate, and Health*

August 12, 2021

Agenda and Ground Rules

- Agenda Review and Ground Rules
- Opening Poll
- Residential Network Overview and Upcoming Call Schedule
- Featured Speakers
 - **Ronnen Levinson**, Lawrence Berkeley National Laboratory
 - **Brett Bishop**, Franklin Energy
 - **Vince Romanin**, Gradient
- Open Discussion
- Closing Poll and Announcements

Ground Rules:

1. **Sales of services and commercial messages are not appropriate** during Peer Exchange Calls.
2. Calls are a safe place for discussion; **please do not attribute information to individuals** on the call.

The views expressed by speakers are their own, and do not reflect those of the Dept. of Energy.

Better Buildings Residential Network

Join the Network

Member Benefits:

- Recognition in media and publications
- Speaking opportunities
- Updates on latest trends
- Voluntary member initiatives
- One-on-One brainstorming conversations

Commitment:

- Members only need to provide *one number*: their organization's number of residential energy upgrades per year, or equivalent.

Upcoming Calls (2nd & 4th Thursdays):

- *9/9: Behavior Change, Efficiency and Climate: What Really Happens vs. Models & Assumptions*
- *9/23: Emergency Replacement: The Biggest Real-World Obstacle to Efficiency*

Peer Exchange Call summaries are posted on the Better Buildings [website](#) a few weeks after the call

For more information or to join, for no cost, email bbresidentialnetwork@ee.doe.gov, or go to energy.gov/eere/bbrn & click Join

Call Attendee Locations

Opening Poll

- What is your organization's experience or familiarity with the relationship between air conditioning, climate, and health?
 - Very experienced/familiar
 - Some experience/familiarity
 - Limited experience/familiarity
 - No experience/familiarity
 - Not applicable

The Cost of Cooling: Air Conditioning, Climate, and Health
12 August 2021

1 Cool Walls

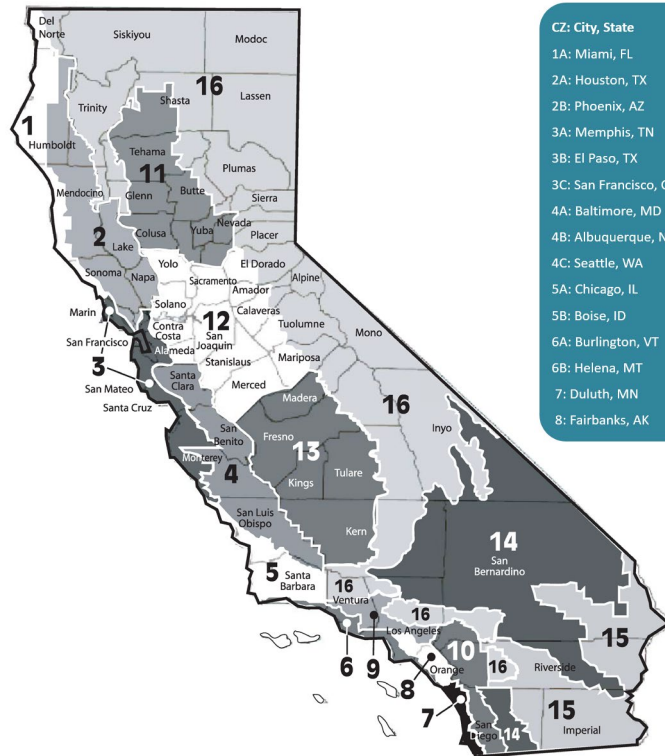

A **cool exterior wall** reflects sunlight to reduce need for air conditioning—saving energy, money, and carbon

Wall solar reflectance

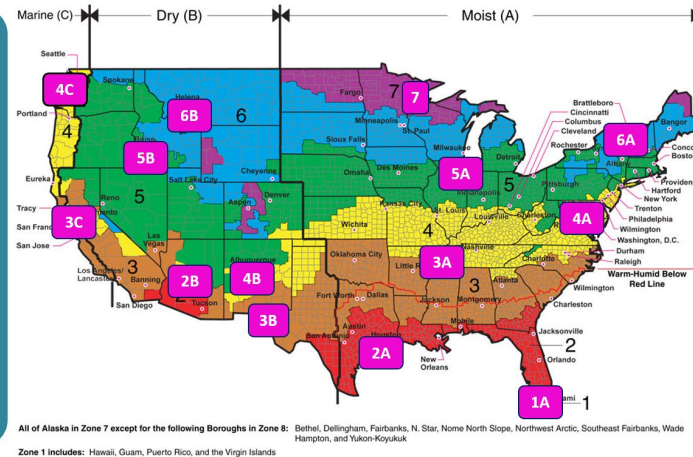

- Conventional $\approx 25\%$
- Cool color $\approx 40\%$
- Off or dull white $\approx 60\%$
- Bright white $\approx 80\%$

We evaluated annual energy, cost, and emission savings in each California and U.S. climate zone (> 100K simulations!)

CZ: City, State
1A: Miami, FL
2A: Houston, TX
2B: Phoenix, AZ
3A: Memphis, TN
3B: El Paso, TX
3C: San Francisco, CA
4A: Baltimore, MD
4B: Albuquerque, NM
4C: Seattle, WA
5A: Chicago, IL
5B: Boise, ID
6A: Burlington, VT
6B: Helena, MT
7: Duluth, MN
8: Fairbanks, AK

All of Alaska in Zone 7 except for the following Boroughs in Zone 8: Bethel, Dillingham, Fairbanks, N. Star, Nome North Slope, Northwest Arctic, Southeast Fairbanks, Wade Hampton, and Yukon-Koyukuk
Zone 1 includes: Hawaii, Guam, Puerto Rico, and the Virgin Islands

Cool walls save energy, carbon dioxide in homes, offices, and stores in all California climates and U.S. climate zones 1 – 4.

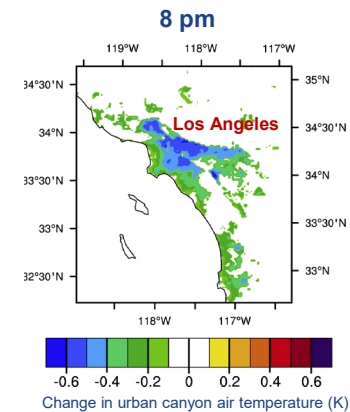

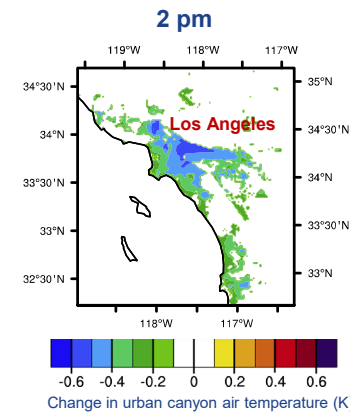

Rosado et al. (2019).

<https://doi.org/10.1016/j.enbuild.2019.02.028>

In July, reflective walls in Los Angeles cool outside air nearly as much as reflective roofs

Cool walls vs. cool roofs: 44% less cooling at 2 pm

6% more cooling at 8 pm

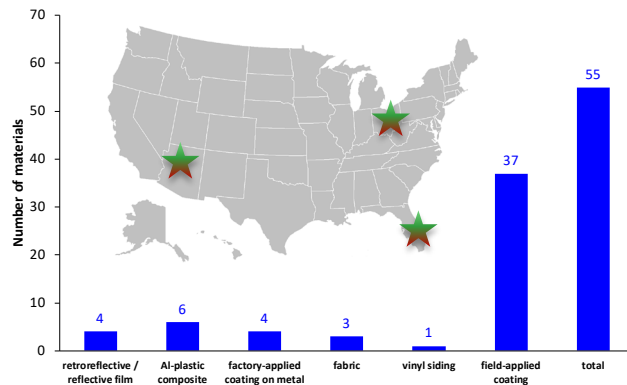

Zhang et al. (2018). <https://doi.org/10.1021/acs.est.8b00732>

Cool-wall products with high solar reflectance (SR) are sold today

NEWS CENTER

Can't Take the Heat? 'Cool Walls' Can Reduce Energy Costs, Pollution

Nationwide study by Berkeley Lab details benefits of lighter-colored, solar-reflective walls

News Release Glenn Roberts Jr. (510) 486-5582 • July 9, 2019

164 SHARES

Coating exterior walls with solar-reflective paints can lead to substantial energy savings in hot climates while curbing pollution, a Berkeley Lab study concludes. (Credit: iStock/YayaErnst)

IF THESE WALLS COULD TALK, they might tell you that cutting energy costs and pollution may be as easy as giving them a fresh coat of lighter, more reflective paint.

<https://newscenter.lbl.gov/2019/07/09/cool-walls-can-reduce-energy-costs-pollution>

NEWS CENTER

'Cool Walls' Get a Boost from U.S. Green Building Council

Berkeley Lab research helps city-cooling measure get test integration with LEED rating system

Feature Story Julie Chao (510)486-6491 • May 18, 2021

20 SHARES

White buildings stand along an alley in Los Angeles, California. Light-colored paints can help reflect sunlight, helping to cool cities and fight the urban heat island effect. (Credit: iStock)

Sunlight-reflecting "cool walls" have been shown to reduce energy costs by lowering heat gain in buildings. But they do more – reflective walls can also cool cities, fighting the urban heat island effect. The concept has new support from the U.S. Green Building Council (USGBC), which has issued a pilot credit for the installation of cool exterior walls in new homes, schools, and commercial buildings to mitigate urban heat islands.

③ Cal-THRIVES: A California Toolkit for Heat Resiliency in Underserved Populations

Heat is increasingly brutal in California's Central Valley, where low incomes, poor air quality, old homes, and high utility bills disadvantage many residents

California and Fresno are hot ...and getting

22 extreme heat days/year by 2040 - 2060
55 extreme heat days/year by 2080 - 2099

<https://www.theguardian.com/us-news/2021/jul/10/california-central-valley-extreme-heat-race>

The California Strategic Growth Council is sponsoring research to help Fresno residents adapt to extreme heat

CAL-THRIVES: A California Toolkit for Heat Resiliency in Underserved Populations

Principal Investigator:
Max Wei, LBNL
MWei@LBL.gov

Max Wei(1), Ronnen Levinson (1), Tianzhen Hong(1), Kai-yu Sun(1), Zhao-yun Zeng(1), Wanni Zhang(1), Yu-jie Xu(1), Henry Willem(1), Susan Mazur-Stommen(2), Haley Gilbert(2), George Ban-Weiss(3), Alexandra Bruce(3), Yuxi Liu(3), Kayley Butler(3), Janice Mathurin(4), Yolanda Sue Randles(4)

(1) Lawrence Berkeley National Lab; (2) Indicia Consulting; (3) University of Southern California; (4) West Fresno Family Resource Center

CALIFORNIA
STRATEGIC
GROWTH
COUNCIL

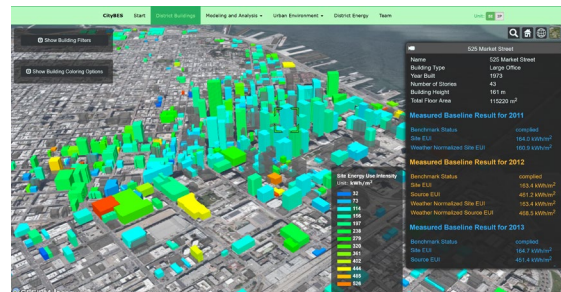

Our heat-resiliency recommendations will incorporate both community input and science

Community engagement

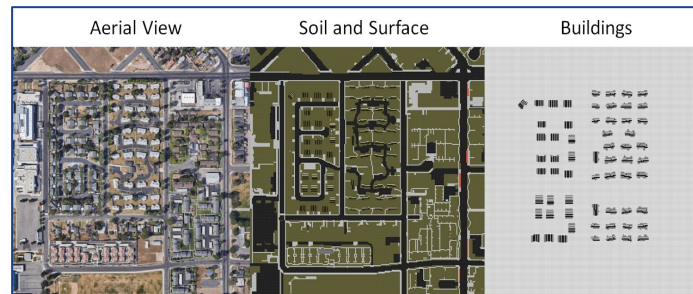

Neighborhood-scale building modeling

Cooling center optimization

Outdoor measure modeling

Heat Resilience Toolkit

Fact sheets
Modeling outputs
Heat vulnerability index tool
Online tools (videos, webinars)
Policy/program recommendations

We're modeling **nine passive indoor cooling measures** in a worst-case heat wave, with and without grid power available

Window blinds

Window overhangs

Cool roof

Cool walls

Storm windows

Solar-control window films

Roof insulation

Radiant barrier

Natural ventilation

We're also evaluating eight active indoor cooling measures and four passive outdoor cooling measures

ACTIVE INDOOR

Ceiling fans

Attic fan

Portable fans

Evaporative cooler

Central AC

Mini-split AC

Window AC

Portable AC

PASSIVE OUTDOOR

Cool pavements

Cool walls

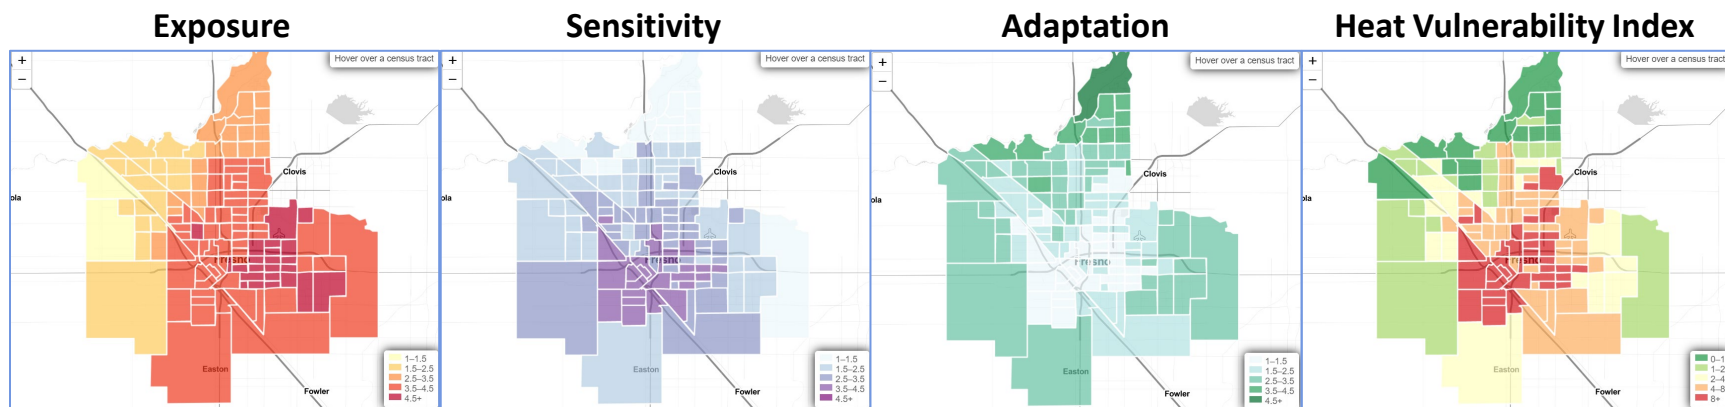

Trees

Canvas canopies

Our Heat Vulnerability Index Tool will map exposure, sensitivity, adaptation, and overall heat vulnerability

Number of hours with high heat index
Longest number of consecutive heat-wave days
Number of heat-wave days
PM2.5 concentration
Ozone concentration
Building heat resistance indicator

Percent elderly and under 5
Percent of pop. without high school degree
Percent of pop. below poverty level
Percent non-white pop.
Percent of pop. with ambulatory disability
Asthma hospitalization rate
Heart attack rate
Percent of pop. with a cognitive disability

Median income
Percent of area covered in parks

Highest vulnerability in south/central Fresno with high sensitivity and low adaptation

<https://citybes.LBL.gov/?hvi=1>

Cal-THRIVES modeling results and toolkit will be available early next year

- Estimated reductions in
 - Indoor air temperature
 - Unmet degree hours
 - Heat index danger hours
- Recommendations
 - Passive, active measures
 - Building code innovations

④ IEA Annex 80: Resilient Cooling of Buildings

IEA Annex 80: Resilient Cooling of Buildings (2019 – 2023)

16 countries exploring passive/low-energy cooling solutions with three goals:

- Make building occupants more resilient to hot weather, boosting comfort, health, and productivity
- Make building cooling systems more resilient to hot weather, improving their ability to meet cooling load
- Make the electric grid more resilient to hot weather, reducing failures

Cool roofs

Solar-control windows

Ceiling fans

Cool walls

Window shading

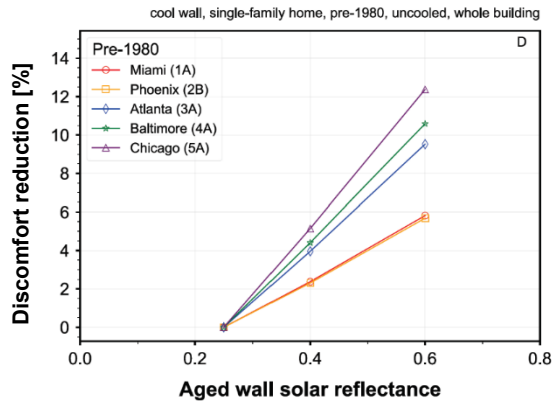

Natural ventilation

Focus of DOE-sponsored project at Berkeley Lab & UC Berkeley

<https://annex80.iea-ebc.org>

Example: Individual passive or low-energy cooling measures can **reduce overheating** in a U.S. pre-1980 single-family home without AC **by up to 70%**

Cool walls

Exterior shading

Natural ventilation

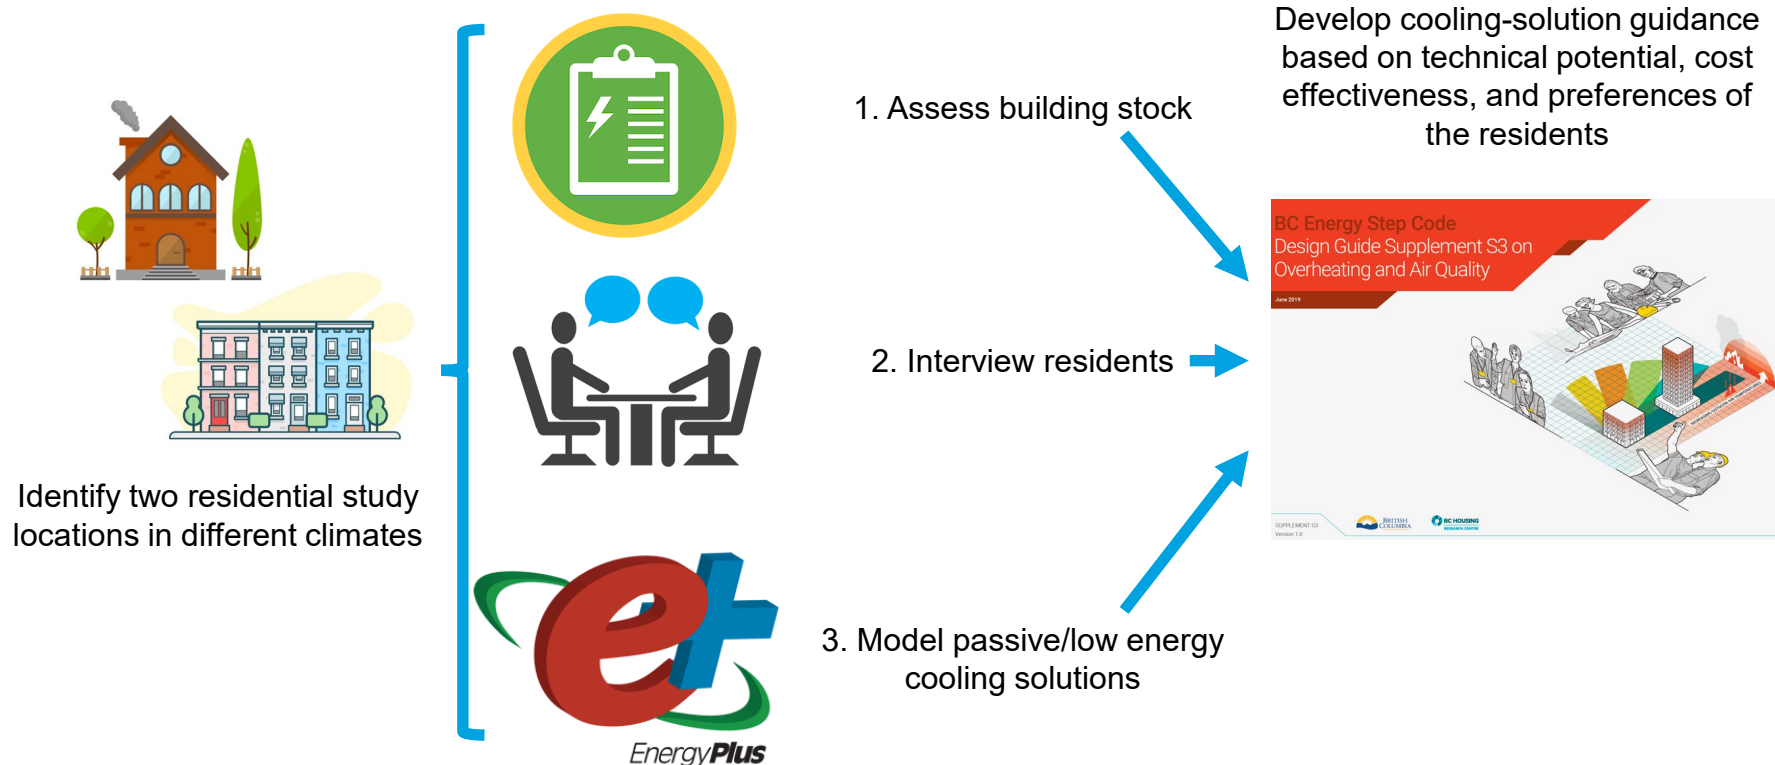

Ceiling fans

Discomfort = annual discomfort-weighted warm exceedance hours (ASHRAE Standard 55-2019)

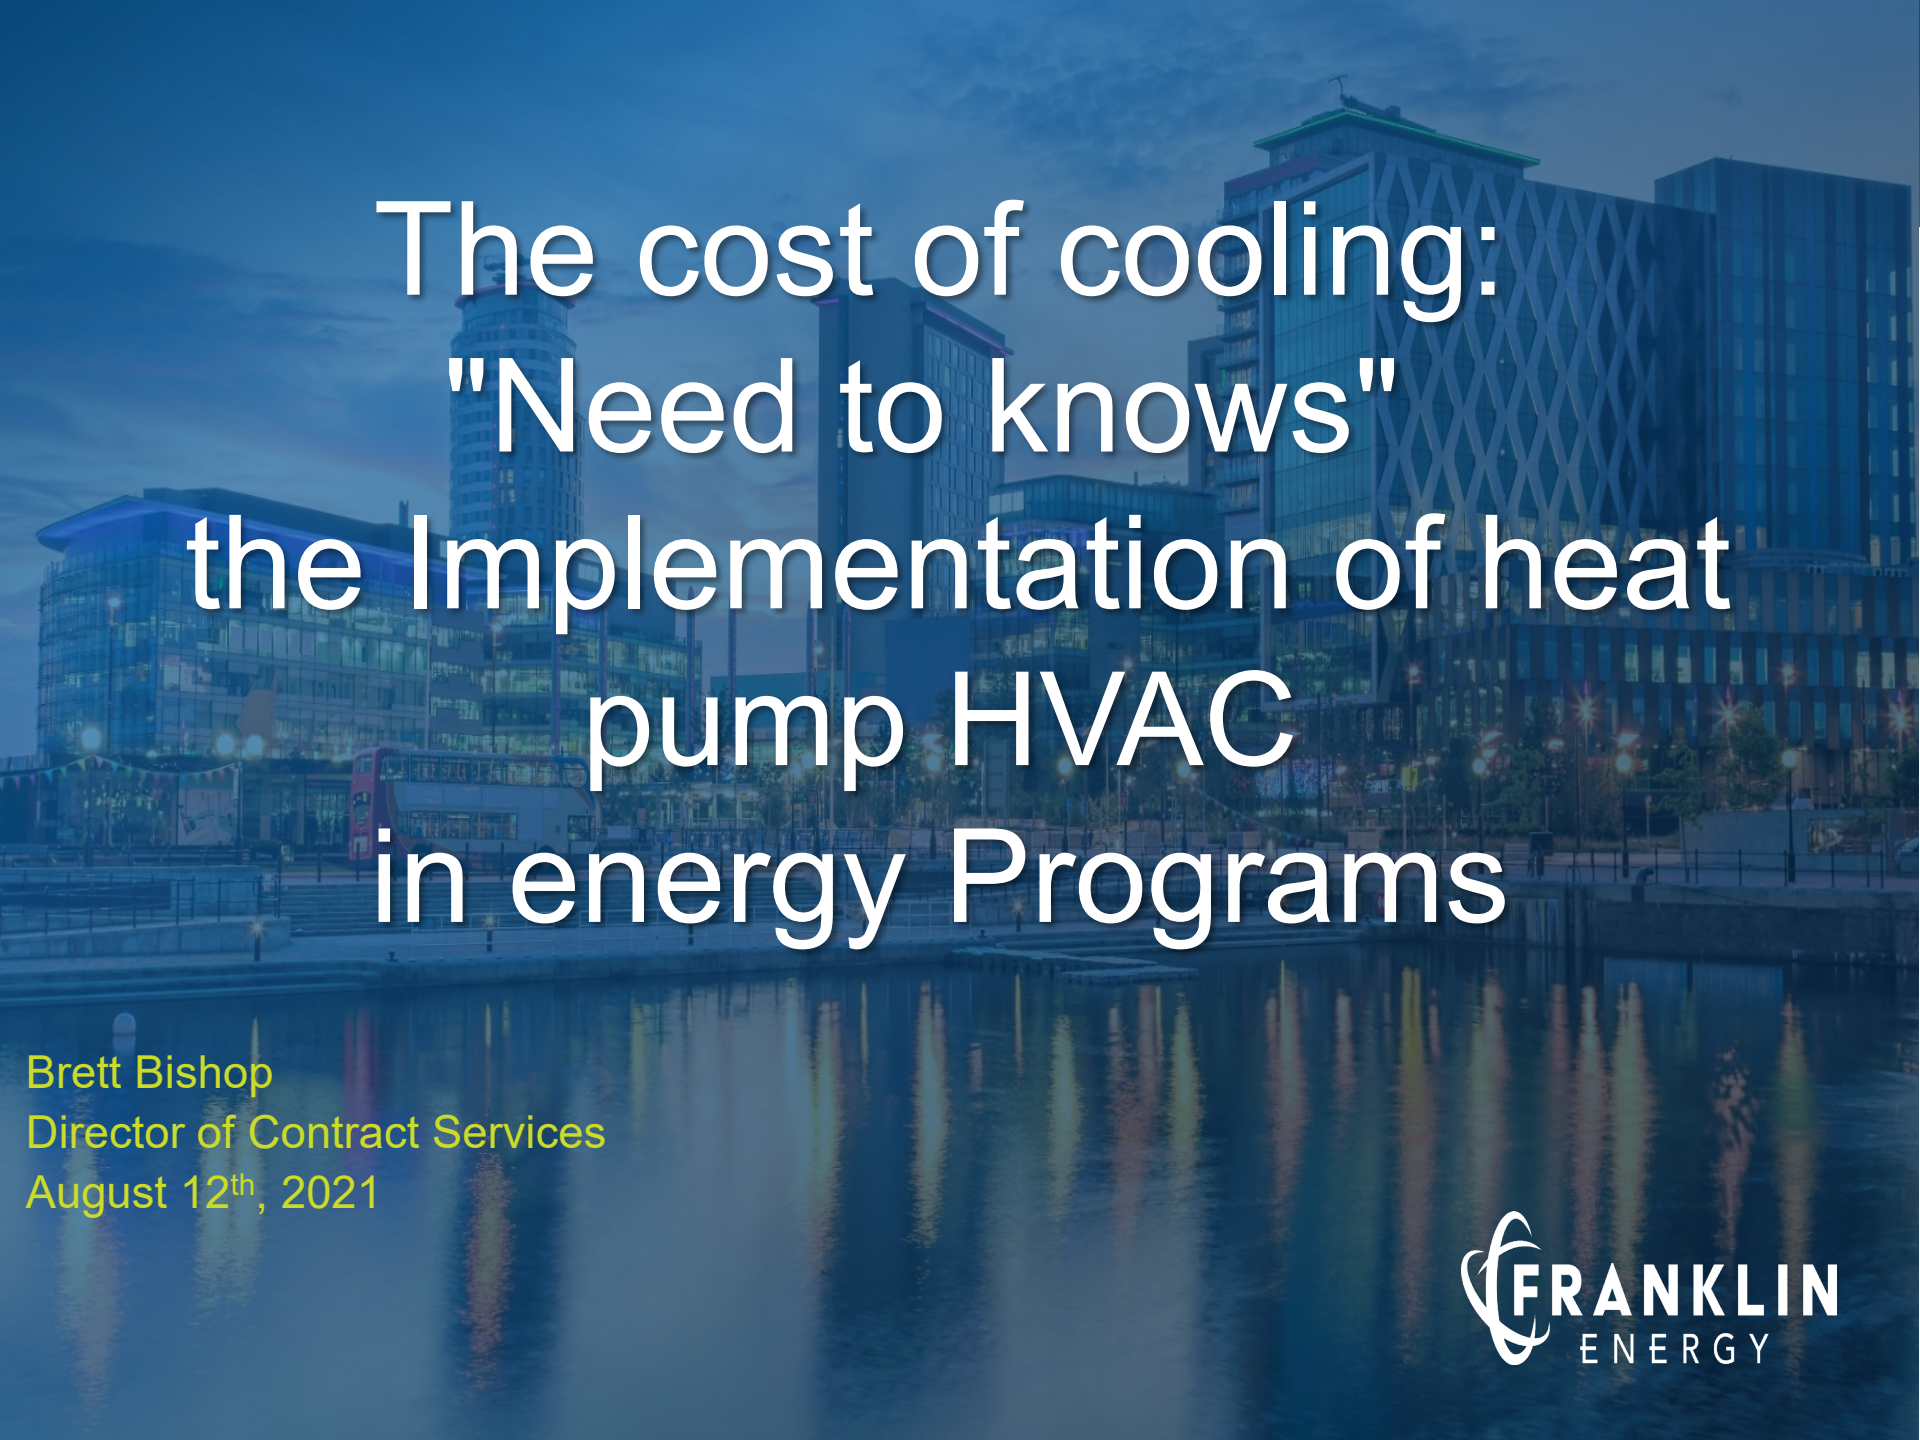

We will customize suites of passive/low-energy cooling solutions in another two disadvantaged communities: **Atlanta, GA** and **Mystic River, MA** (near Boston)

Thank you!

Brett Bishop
Franklin Energy

The cost of cooling: "Need to knows" the Implementation of heat pump HVAC in energy Programs

Brett Bishop
Director of Contract Services
August 12th, 2021

Introduction & *Conclusion*

“Continuous improvement is better than delayed perfection.”

Mark Twain

1. Multiple benefits exist with Heat Pump HVAC
 - All non-energy benefits we know and love about energy efficiency will *NOT* be covered
 - Improved air quality, Comfort, quality of LIFE!
 - For this audience these are knowns
 - Population level load management
 - Increased load management opportunities
2. Solutions should be tailored at the site level
 - Barriers are varied by site and socioeconomics
 - Contractor training is critical
 - Shell measures optimize results
 - Heat Pump Technology is robust, proven, valuable, and synergistic with Grid Ops
3. Infrastructure improvements have impacts at the Portfolio Level and are inaccurately attributed
4. All stakeholders benefit if we get this right
 - The entire supply chain benefits and should be called upon for their unique specialties
5. We need to get this right the first time
 - **Reliably drives the market!**

DUCTED AIR SOURCE HEAT PUMPS

Split Systems

- Bi-Directional Refrigerant Flow
- Outdoor Condenser
- Indoor Air Handler
- **Refrigerant Line Field Installed**
- Two Circuits

Package Units

- Bi-Directional Refrigerant Flow
- Outdoor and Indoor Units in One
- Ducted through Roof or Subfloor
- **Refrigerant “Charged” at Factory**
- One Circuit

Water Heating is Very Different

- ***Single Direction Refrigerant Flow***
- ***Indoor Application Predominate***
- ***Refrigerant Charged at Factory***
- ***May Need Ducting due to Cold Air Discharge***
- ***One Circuit***

Approaches to HVAC System Demand

- Two Stage and Variable systems perform better from demand management and customer experience perspectives
- Two stage has been around a 20+ years and is often baseline for end user financed systems

100%

Single-stage

65% & 100%

Two-Stage

40% - 100%

Variable Capacity

HVAC System Demand Dynamics

HP Only w/ 5 to 20 kW "Booster Heater"	Hybrid System	Variable Refrigerant Flow & "Oversizing"
1st Stage Heat is achieved by Heat Pump	1st Stage Heat is achieved by Heat Pump	Entirely HP Operation
2nd Stage is a LARGE DEMAND Electric Heater	2nd Stage is a Gas Burner	
Requires (2) 230 Volt Circuits	Reuse Existing Service for both Split & Package Systems	May or may not require electric service upgrades
Electric Resistance during Peak Grid Demand	Manages Demand during Peak Grid Demand	Manages Load 24/7/365
Lowest Cost	Mid-Range Cost	Highest Cost
Resistance heat is typically not captured by programs (invisible)	Will not appear to be fuel switching	Will falsely appear to be additional load

A 5 kW Solar Array will typically need 18 panels

Utility Service by Solution

HP Only w/ 5 to 20 kW “Booster Heater”

- Package Units will have a serviceable circuit existing
- Dual fuel Split Systems will have 230 Volts at the condenser and 115 Volts at the Air Handler
- Rewiring the Air Handler location to 230 Volts may be required for booster heat.
- 115 Volt Air Handlers exist and may work in some applications

Hybrid System

- Any dual fuel existing system will have the utilities needed where the equipment is located, this applies to both Split and Package systems

Variable Refrigerant Flow & “Oversizing”

- Split systems will require (2) 230 Volt circuits
- Package Systems will require (1) 230 Volt circuit
- Larger homes with poor shell measures may need booster heat or multiple systems, multiple systems is more costly yet manages loads better
- Shell measures are always most cost effective

Secondary heating should only operate at or below freezing

Breaker Panel Concerns

100 AMPS OR LESS EXITING

- Potential to reuse circuits if there is enough capacity for existing and one or *maybe* two new circuits
- Potential to expend resources on new circuits and need a panel replacement later
- **Some level of service will be needed in any case**

200 AMP PANEL EXITING

- Typically, enough capacity to facilitate Renewables, Heat Pumps, and Evs
- Adding Heat Pumps or EV Charging Stations will require new or repurposed circuits
- **New circuit costs are easily attributed to measures**

NEWER & OLDER CONSTRUCTION

- **NEWER** construction typically has 200 Amp service existing with space and/or unused circuits
- **OLDER** construction typically needs panel improvements
- **Older homes in rural locations are likely to have 200 Amp service**
- **Every home is unique**

PANEL REPLACEMENT

- Costs vary by site conditions **Overlap with renewables and transportation**
- Detached garages cost more due to trenching
- Need and complexity in managing costs is greater
- **Where should costs be attributed?**
- **Income qualified customers need more support**

An excellent example of Service Panel Rebates

What's done right here:

- Multiple Sectors Addressed
- Market Rate and Income Qualified get “Right Sized” Incentives
- Measure and Panel upgrade costs are captured distinctly

Implementation Concerns:

- Rich incentives in Income Qualified *may* lead to contractor price gauging
- More site data needed to verify need level
- Field QA/QC safeguards are more important, but can be redundant with code required inspections
- Data gathering to improve program operations is more robust than historical deemed savings programs

CHARGE YOUR RIDE

ELECTRIC VEHICLE CHARGER PROGRAM

TYPE OF PROJECT	BASE INCENTIVE: HOMEOWNER	BASE INCENTIVE MULTI-FAMILY, COMMERCIAL, INDUSTRIAL, & AG CUSTOMERS	INCOME QUALIFIED INCENTIVE & PUBLIC AGENCY INCENTIVE
LEVEL 2 CHARGER ONLY	\$400	up to \$1,000 ea. (3 chargers max)	up to 100% of project cost (\$10K max)
ELECTRICAL WORK	up to \$2,000	70% of project cost (\$7K max)	
MAX INCENTIVE	\$2,400	\$10,000	\$10,000

LEARN MORE AND APPLY AT: 3Cenergy.org

@3Cenergy    

- Older buildings will need more significant improvements
- Disadvantaged communities will have older buildings
- Newer buildings will have circuits that can be repurposed

Customers with Solar installed typically have corrected and/or upgraded service panels

- Building Departments and Code Officials view PV as added load on a system
- All in home end uses + PV system capacity dictates service capacity

Communities will have infrastructure costs to manage

- At the site level
 - The feeder wire coming to the meter may be too small
- At the neighborhood level
 - The transformer serving a neighborhood will **eventually** need upgrading with attrition or increases in demand
- At the grid level
 - Population growth and usage trends , including but limited to EVs and HPs, will incur infrastructure improvements

LOAD MANAGEMENT

Load Managements Systems can be simple or complex.

A simple system may only share load from dryer to an EV in the garage.

Smart breaker panels manage all loads, storage, EV, and PV, through phone apps with customized priorities and reports.

Moderate Climates with historically low cooling loads may have a significant percentage of heat only systems

- **All HVAC HP Systems will provide both heating and cooling**
- **Adding AC where it did not exist before can be viewed as adding load**
- **As our climate continues to change market demand for cooling will increase**
- **Disadvantaged communities will be most effected by climate change**
- **How will the market respond to new demand for cooling if they are not aided by an energy professional?**

HEAT ONLY TO HP SYSTEMS, ADDITIONAL LOAD?

- **Window AC is low cost, mobile, installed by lay people, introduce outside air, and are inefficient**

- **Systems will run more frequently if shell measures are poor or absent**
- **Climate change will result in increased energy burden and harmful emissions**

Newer systems can enable thermal storage, demand response, and Grid Harmonization.

HVAC programs succeed when they engage the entire market

- **Manufacturing**
- **Distribution**
- **Trade Pros**
- **End users**

- **Shell measures will reduce system sizes, frequency of operation, and run times**

- **A well-trained workforce does better quality work**
- **Utilities and local governments get greater visibility into the market**

Effective
implementation of HP-
HVAC in energy
efficiency programs

Lessons from the road

MARKET RATE & INCOME QUALIFIED

Comfortable Home Rebates PG&E

- Market Rate Program
- Meter Based Savings (NMEC)
- Contractor driven sales process
 - Education & training
 - Technical
 - Sales
 - Business Ops
 - Home as a system
- Rebate Level Considerations
 - Big enough to spur action
 - Small enough to manage the budget
 - **Only measures that produce at the meter**

Home Energy Savings MCE

- Equity Program
- Deemed Savings
- Neighborhood level customer outreach
- Customers can be cynical about any program due to prior experiences
- Customers often fear “new” technologies even if it’s free
- Customers routinely fear the permitting process

What Happens if we get this wrong?

The most important factors considered when choosing an HVAC system are:

1. The system will operate for a long time without needing to be serviced or replaced
2. The operating cost
3. Always produces the desired air temperature
4. Purchase price is also important among the buying segment

Frank Landwehr
Emerson Climate Technologies
Residential Market Study 2015

Solar Thermal Lessons Learned,

*“In the 1970s, solar thermal water heating rebates were generous, contractors installed them en masse, and most never reached their full potential. **Solar thermal systems leaked, the tanks failed, and overall, it was not a successful effort.**”*

Charley Cormany
Efficiency First California 2021

Lighting Lessons Learned,

*“**After imprudently producing low quality CFLs that spurred consumer dissatisfaction and created negative perceptions,** the large lighting manufacturers determined that they would not promote LED products until they were truly ready, despite the desire to be first to market.”*

PNNL 2006

Multiple benefits to panel Upgrades

- Improvements in electrical infrastructure impacts,
 - HVAC
 - Renewables
 - Water Heating
 - Transportation

How can infrastructure costs be attributed to any one program or measure?

Food for thought,

Should the utility providers be allowed to include behind the meter improvements to capital improvement budgets (T&D) in Disadvantaged Communities?

Should HP driven technologies qualify Market Rate customers for lower rates? (i.e., “electric only”)

“Continuous improvement is better than delayed perfection.”

Mark Twain

CONCLUSION

1. Multiple benefits exist with Heat Pump HVAC
 - Population level load reduction
 - Increased load management opportunities
 - All non-energy benefits we know and love about energy efficiency
 - Improved comfort, air quality, etc.
2. Solutions should be tailored at the site level
 - Barriers are varied by site and socioeconomics
 - Contractor training is critical
 - Shell measures optimize results
 - Heat Pump Technology is robust, proven, valuable, and synergistic with Grid Ops
3. Infrastructure improvements have impacts at the Portfolio Level and are inaccurately attributed
4. All stakeholders benefit if we get this right
 - The entire supply chain benefits and should be called upon for their unique specialties
5. We need to get this right the first time
 - Reliably drives the market!

The screenshot shows the GoTo Webinar interface. On the left is a vertical control panel with icons for navigation, audio, and a hand icon. The main window has two sections: 'Audio' and 'Questions'. In the 'Audio' section, the 'Phone call' option is selected and highlighted with a red box. Below it, the dialing information is shown: 'Dial: +1 (914) 614-3221', 'Access Code: 445-689-091 #', and 'Audio PIN: 87 #'. In the 'Questions' section, there is a text input field with the placeholder '[Enter a question for staff]' and a 'Send' button. This input field is also highlighted with a red box. At the bottom, the 'Webinar ID: 640-559-859' and the 'GoToWebinar' logo are visible.

Please use the
questions box to
submit questions,
comments, or
alert us of
technical
difficulties

If you have called in on a phone today, double check that you've selected telephone as your audio option.

Closing Poll

- **After today's call, what will you do?**
 - Consider implementing one or more of the ideas discussed
 - Seek out additional information on one or more of the ideas
 - Make no changes to your current approach
 - Other (please explain)

A stylized sunburst with yellow rays emanating from behind the word 'STEM'.
